

CSAT Analytics Insights Report

1. Data Quality Finding

Observation:

Out of **32,941** customer interactions, **20,670 CSAT scores (62.75%)** were missing or unrecorded, leaving only **12,271 valid responses (37.25%)** for satisfaction analysis. The highest number of missing scores came from the **Call-Center (6.7K)**, followed by **Chatbot (5.1K)**, **Email (4.7K)**, and **Web (4.2K)**. The overall average CSAT score across all valid responses is 2.07 out of 10.

Interpretation:

With nearly **two-thirds of customer feedback unavailable**, the overall CSAT results may not fully represent the customer experience. Since the Call-Center also handles the highest interaction volume, its large number of missing scores has the greatest impact on reporting accuracy and business decision-making. On a standard 1-10 scale, an average score of 2.07 is critically low. This indicates severe, widespread customer dissatisfaction across the handled interactions.

Recommendation:

Implement mandatory CSAT capture after every interaction, monitor missing-score rates by channel through automated data-quality alerts, and prioritize improving feedback collection in the **Call-Center**, where the largest volume of missing responses originates. Treat this 2.07 score as an urgent operational red flag while simultaneously addressing the data collection gap.

2. Sentiment Skews Negative

Observation:

Customer sentiment is predominantly negative. Out of **32,941 interactions**:

- **Negative: 11,063 (33.58%)**
- **Neutral: 8,754 (26.57%)**
- **Very Negative: 6,026 (18.29%)**
- **Positive: 3,928 (11.92%)**
- **Very Positive: 3,170 (9.62%)**

Combined, **Negative + Very Negative account for 17,089 interactions (51.87%)**, whereas **Positive + Very Positive represent only 7,098 interactions (21.54%)**.

Interpretation:

More than **half of all customer conversations ended with negative sentiment**, indicating that customer issues are not consistently being resolved to customer expectations. Positive experiences are significantly outnumbered by dissatisfied customers, suggesting opportunities to improve service quality and issue resolution.

Recommendation:

Analyze the primary drivers behind negative interactions, improve agent coaching, reduce repeat contacts, and regularly monitor sentiment trends to identify operational issues before they affect customer satisfaction.

3. SLA Performance Tracks Satisfaction

Observation:

62.61% of interactions were completed **Within SLA**, while **24.74%** were **Below SLA** and **12.65%** were **Above SLA**.

Average CSAT by SLA category:

- **Above SLA: 5.62**
- **Below SLA: 5.56**
- **Within SLA: 5.53**

The difference between the highest and lowest average CSAT is only **0.09 points**.

Interpretation:

Although most interactions meet SLA targets, customer satisfaction remains relatively consistent across all SLA categories. This suggests that **meeting response-time targets alone is not the primary driver of customer satisfaction**. Factors such as issue resolution quality, communication, and customer experience likely have a greater influence.

Recommendation:

Continue maintaining strong SLA compliance while focusing more on first-contact resolution, agent effectiveness, and service quality rather than relying solely on response-time performance.

4. Channel Performance Gap

Observation:

Interaction volume by channel:

- **Call-Center: 10,639**

- **Chatbot: 8,256**
- **Email: 7,470**
- **Web: 6,576**

Average CSAT by channel:

- **Call-Center: 5.61**
- **Web: 5.59**
- **Chatbot: 5.49**
- **Email: 5.48**

The difference between the highest and lowest performing channels is only **0.13 CSAT points**.

Interpretation:

The **Call-Center** not only manages the largest workload but also achieves the highest customer satisfaction, demonstrating consistent service performance under high demand. **Email** records the lowest average CSAT, suggesting customers may experience slower or less satisfactory issue resolution through this channel.

Recommendation:

Review Email support processes to identify delays and resolution gaps. Replicate successful Call-Center practices—such as response handling and agent workflows—across digital channels to improve overall customer experience.

5. Contact Reason Concentration

Observation:

Average CSAT varies slightly across customer contact reasons:

- **Payments: 5.63** (*Highest*)
- **Billing Question: 5.54**
- **Service Outage: 5.52** (*Lowest*)

The overall variation between the highest and lowest-performing reasons is only **0.11 CSAT points**.

Interpretation:

Customers contacting support regarding **Payments** report the highest satisfaction, indicating that payment-related issues are generally resolved efficiently. **Service Outage** cases receive the lowest satisfaction, which is expected because outages often involve factors beyond immediate agent control and may require longer resolution times.

Recommendation:

Prioritize improving communication during service outages by providing proactive updates, estimated resolution times, and transparent status notifications to reduce customer frustration.

6. Call Center Performance Spread

Observation:

Average CSAT by call center location:

- **Denver: 5.62**
- **Baltimore: 5.56**
- **Los Angeles: 5.55**
- **Chicago: 5.48**

The overall performance difference between the highest and lowest call centers is **0.14 CSAT points**.

Interpretation:

While customer satisfaction remains relatively consistent across all call centers, **Denver** demonstrates the strongest performance and can serve as a benchmark for operational best practices. **Chicago** records the lowest average CSAT, indicating potential opportunities to improve agent training, workflow efficiency, or quality assurance.

Recommendation:

Conduct a performance review of the Chicago call center, compare its operational processes with Denver's best practices, and introduce targeted coaching and quality monitoring to improve customer satisfaction consistency across locations.
